

MicroLaserPeel®

**The easy and effective way to
improve skin texture & appearance**

What is MicroLaserPeel?

A MicroLaserPeel is a quick and effective treatment that uses a special laser to address conditions on the top layer of your skin

Main reasons to have a MicroLaserPeel:

- Erases solar damage (such as sun spots) and fine lines
- Makes the skin look more healthy & radiant
- Minimal downtime
- Quick in-office procedure
- Much more effective and precise than microdermabrasion
- Combines with other procedures for improved results

How does MicroLaserPeel work?

- MicroLaserPeel precisely ablates (vaporizes) a very thin layer of skin, removing old, damaged tissue
- Some superficial blemishes such as sun spots and pigment irregularities are removed in the process
- Healthy, vibrant-looking skin re-grows in its place, returning a youthful glow to your face

What else should I know?

- MicroLaserPeel works for virtually all skin types
- Can treat most body parts (common areas are face, neck, chest and hands)
- Combines well with other types of cosmetic treatments
- The laser can be easily fine-tuned for:
 - Individual skin conditions
 - A patient's desired outcome
 - Downtime expectations
